

NFV-Powered Virtual CPE Solution from Accedian Now Deployed by 7 Global Service Providers

New video shows the SkyLIGHT VCX Controller story—a solution that drives data center access revenue, reduces hardware and operating costs, and assures performance-optimized hybrid cloud connections

Montreal, Canada – May 21, 2015 - [Accedian Networks](#), the Performance Assurance Solution Specialist, today announced the deployment of its SkyLIGHT™ VCX platform across seven global service provider networks. The network function virtualization (NFV)-powered virtual customer premises equipment (vCPE) solution is revolutionizing the ability for service providers to assure performance of hybrid cloud connections, while reducing hardware and operating costs, and most importantly, driving data center access revenue. The solution’s “story” was also unveiled today in a candid “behind the scenes” [video](#), showing how VCX was created from Accedian DNA, distilling 10 years of innovation into NFV technology that now powers the company’s “bite-sized” programmable hardware modules.

A total of seven global service providers are utilizing Accedian’s vCPE solution in production environments as part of their NFV strategy, including four mobile operators in Asia, Europe and the Middle East; also deployed in North America by two of the largest multi-service cable operators (MSOs) and a Tier-1 wireline carrier.

“As Gartner has reported, more than 70 percent of Fortune 500 companies have shifted in-house IT infrastructures to public and private data centers, and the ability for service providers to continue to deliver the highest quality of service levels through reliable and cost effective measures is paramount,” stated Accedian Founder, President, and CEO, Patrick Ostiguy. “Our vCPE solution, combining the SkyLIGHT VCX and our miniaturized performance modules, fully addresses this need. It gives our customers the ability to support services over increasingly complex and hybrid environments, while simultaneously opening up new revenue opportunities with performance-differentiated services. This is not slideware; it’s in use across the globe and we’re excited to see the accelerated adoption of this market changing solution that takes virtualized instrumentation to new levels of excellence.”

As the [new video](#) shows, taking viewers “behind the scenes” of Accedian’s labs, customers can now easily take advantage of Accedian’s full suite of performance assurance capabilities, but virtualized, and sized and priced to fit increasingly cost-competitive business models.

About Accedian Networks

Accedian Networks® is the Performance Assurance Solution Specialist for mobile networks and enterprise-to-data center connectivity. Open, multi-vendor interoperable and programmable

solutions go beyond standard-based performance assurance to deliver Network State+™, the most complete view of network health. Automated service activation testing and real-time performance monitoring feature unrivalled precision and granularity, while H-QoS traffic conditioning optimizes service performance. Since 2005, Accedian has delivered platforms assuring hundreds of thousands of cell sites globally. www.Accedian.com Twitter: [@Accedian](https://twitter.com/Accedian)
