

Skylight Demo Fair: SD-WAN Performance Visibility with Skylight

Service Providers face significant challenges in providing SD-WAN as a managed service, including differentiating your SD-WAN service from competitors and handling complex multi-vendor environments. The three biggest challenges, according to recent Heavy Reading research, include:

1. Managing SD-WAN seamlessly across multiple services
2. SLA verification across multiple vendors
3. Correlating performance across both the SD-WAN underlay and overlay

This demo shows how Skylight can provide visibility into the underlay network performance and SD-WAN overlay together in a single pane-of-glass view.

Challenges Solved:

- Single pane-of-glass management for monitoring and correlating underlay and overlay connectivity performance
- Normalization of workflows, naming, KPIs, and views across multiple services and vendors with common SLA verification

Why it Matters and for Who:

This solution targets Service Providers and MSPs who are supporting SD-WAN solutions and who experience challenges in managing and visualizing data from multiple layers and vendors. Providing Skylight's end-customer portal access with visibility across multiple layers of information for self-service customer insight provides operational improvements and helps differentiate your SD-WAN offer.
